The use of genetic engineering or gene therapy for the treatment of human disease has been a long-sought dream of scientists across the world. Diseases caused by mutations in single genes are easier to be treated using gene-editing such as sickle cell anemia or cystic fibrosis.

How can Genetic Engineering be used to Treat or Cure Diseases

Gene therapy involves the introduction of normal, healthy genes into cells to correct the underlying cause of a wide variety of inherited and acquired diseases. Future progress in developing effective clinical protocols involving gene therapy for the treatment of cellular dysfunction associated with disease may incorporate metabolic engineering.

Gene therapy and metabolic engineering.

1. Scientists create a genetic sequence known as a "Guide RNA" that matches the piece of DNA they want to modify. 2. The guide RNA sequence is added to a cell along with the Cas9. 3. Guide RNA binds to the target DNA. 4. Cas9 enzyme binds and creates a double stranded break in the DNA. 5a.

This review highlights the advances at the interface between tissue engineering and gene therapy. There are a large number of reports on gene therapy in tissue engineering, and these cover a huge range of different engineered tissues, different vectors, scaffolds and methodology.

### Gene therapy used for tissue engineering applications

Gene therapy (also called human gene transfer) is a medical field which focuses on the utilization of the therapeutic delivery of nucleic acids into a patient's cells as a drug to treat disease.

### Gene therapy - Wikipedia

Genome editing, or genome engineering, or gene editing, is a type of genetic engineering in which DNA is inserted, deleted, modified or replaced in the genome of a living organism. Unlike early genetic engineering techniques that randomly inserts genetic material into a host genome, genome editing targets the insertions to site specific locations.

### Genome editing - Wikipedia

Gene therapy involves the replacement or modification of a genetic variant to restore or enhance cellular function or the improve response to nongenetic therapies. Genetic engineering involves the use of recombinant DNA techniques to introduce new characteristics or traits.
