The Sun S Path Observation Lab Answers

The Sun is not shown, however, the Earth's illumination indicates its position to the left. Because of the Earth's axial tilt, the Sun's assumed location shifts up and down slightly over the course of the year in this animation, appearing on the same horizontal plane as the Earth solely during the March and September equinoxes. The circle shows the Moon's anticipated path in the upcoming weeks, including the next 3 or 4 Moon phases.

The Sun S Path Observation Lab Answers

3. Daily observation. Other than the twice yearly rasd al-qibla, in any location usually there is a moment each day when the Sun and its shadow points to the qibla, or its exact 180 ° opposite, because the Sun crosses the direct path between the location and the Kabah. However, the time of this daily event varies by place and by the day of the year.

Qibla observation by shadows. Twice every year, the Sun culm

During the period from around October to February, Earth ' s orbital speed is much faster than at any other time of year. This changing speed affects the position of the sun in the sky and how much earlier or later the sun reaches its noon position. The result is the analemma, a figure-eight shaped path of the sun in the sky over the course of a year. This year-long activity is designed to make visible this remarkable aspect of the Earth-sun system, one of the most striking patterns in nature.
